Patent No. 5874255;
GENERAL INFORMATION:
APPLICANT: NAKAMURA, KAZUYASU
APPLICANT: KOITE, NASAMCHI
APPLICANT: SHITARA, KENYA
APPLICANT: KUWANA, YOSHHISA
APPLICANT: KUWANA, YOSHHISA
APPLICANT: HASEGAWA, MAMORU
ITILB OF INVENTION: HUMANIZED ANTIBODIES
CLASSIFICATION: 424
ATTORNEY/AGENT INFORMATION:
NAME: WILLSON, MARY 32,955
REGISTRATION NUMBER: 32,955
REFERENCE/DOCKET NUMBER: 249-5
TELECHOMULICATION INFORMATION:
TELEPHONE: (703)816-4000
TELEPHONE: (703)816-4100
INFORMATION FOR SEQ ID NO: 3:
SEQUENCE CHARACTERISICS:
LENGTH: 137 amino acids
TYPE: amino acids
TYPE: amino acids

Sequence 158, Application US/09647468

Patent No. 6677436

GENERAL INFORMATION:
APPLICANT: SATO, KOH
APPLICANT: AABUTA, NAOHIRO
TITLE OF INVENTION: HUMANIZED ANTIBODY AGAINST HUMANIZED ANTIBODY
TITLE OF INVENTION: PROCESS OF PRODUCTION OF THE HUMANIZED ANTIBODY
TITLE OF INVENTION: HUMBER: US/09/647,468

CURRENT PELING DATE: 1999-04-02

PRIOR APPLICATION NUMBER: PCT/JP99/01768

PRIOR FILING DATE: 1999-04-03

PRIOR FILING DATE: 1998-04-03

PRIOR FILING DATE: 1998-04-03

NUMBER OF SEQ ID NOS: 183

SOFTWARE: PATENTING UNIVER: 2.1

SEQ ID NO 158

LENGTH: 137

```
The present invention describes an isolated antibody, or an antigenbinding antibody fragment (I), that preferentially binds cell-associated binding antibody fragment (I), that preferentially binds cell-associated CR 125/0772 polypeptide relative to shed CA 125/0772 polypeptide. Also described: (I) a monoclonal antibody that competes with binding of (II); (3) a hybridoma as deposited in (II); (4) an isolated nucleic acid molecule (III) comprising a nucleotide sequence that encodes a variable chain region of (I); (5) a pharmaceutical composition comprising an antibody or an antigen-binding antibody fragment that preferentially binds cell-associated CA 125/0772P polypeptide, and a carrier; (6) a pharmaceutical composition comprising on antibody or an antigen-binding monoclonal antibody or an antigen-binding monoclonal antibody or an antigen-binding material and a composition comprising an antibody, or an antigen-binding material and a composition of manufacture (IV) comprising packaging material and a composition of manufacture (IV) comprising packaging material and a composition of preferentially binds cell-associated CA 125/0772P relative to shed CA 125/0772P operably linked to a neterologous attibody fragment, which preferentially binds cell-associated CA 125/0772P relative to shed CA 125/0772P operably linked to a heterologous attibody fragment, (9) ameliorating (MI) a symptom of a CA 125/0772P-relative disorder; (10) a monoclonal antibody (VI) fonemer of CA 125/0772P-relative disorder (10) asymptom of a CA 125/0772P-relative (10) asymptom of a CA 125/0772P-relative (10) asymptom of a CA 125/0772P-relative (10) asymptom of a CA 125/0772P-relative (10) asymptom of a CA 125/0772P-relative (10) CA 125/0772P-relative (10) CA 125/0772P-relative (10) 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel isolated antibody, or antigen-binding antibody fragment binding with cell-associated CA 125/0772P polypeptide relative to shed CA 125/0772 polypeptide, useful for ameliorating cervical or ovarian cancer.

ô
antibody fragment; (11) an antibody or antigen binding antibody fragment that competes with (VI) and (12) a pharmaceutical composition comprising (VI) and acarier. (11) has cytostatic activity, and can be used as an immunostimulant and a mediator of lysis of positive tumour cell. (1) is useful for ameliorating a symptom of a CA 125/O7P-related disorder which is a cell proliferative disorder such as cancer, cervical or uterine cancer, breast or lung cancer or ovarian cancer. (V) is useful diagnostically for monitoring the development or progression of cancer or tumour as part of clinical testing procedure. The present sequence represents an antibody heavy chain variable region amino acid sequence which is used in the exemplification of the present invention.

This sequence represents the heavy chain of the protein of the invention. The protein of the invention is a recombinant protein (A), that comprises at least one region corresponding to an immunoglobulin (Igy variable region which enables the protein to recognise and specifically bind to an antigen, preferably human Fas, and has substantially no more immunogenicity in a human patient than a human antibody. The proteins are useful for treating autoimmune diseases, especially rheumatism (rheumatoid arthritis). (A) is based on a murine monoclonal antibody. As the protein lacks the constant region, it has substantially no more immunogenicity in the human patient than a human antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ...

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Production of anti-Fas protein humanised antibodies - for use in inducing apoptosis on Fas expressing cells in the treatment of auto:immune diseases, especially rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This is the amino acid sequence of the heavy chain of the mouse anti-human Fas monoclonal antibody CHII, as deduced from an amplified CDNA clone (see AAV66735). The invention relates to novel humanised antibodies comprising humanised light and heavy chains (see AAW71876-81) of CHII. These humanised anti-human Fas antibodies are capable of inducing apoptosis in cells expressing Fas (e.g. synovicotytes) and are useful in the treatment of autoimmune disease and chronic rheumatoid arthritis

The present invention relates to antirheumatic agents which comprise as active ingredients an immunoglobulin M (IgM) protein. The IgM protein does not include a J segment, has apoptosis inducing activity, and does not include a J segment, has apoptosis inducing activity, and consists of a light and heavy chain polypeptide produced synthetically. The agents of the invention exhibit antirheumatic and immunosuppressive activity and can be used to treat autoimmune diseases, especially. The IgM molecule used in the invention has bluman Fas-antigen binding properties. Included in the invention are nucleotide sequences of the Immanised anti-human Fas Ig CH11 (see corresponding protein sequences (see AAA122013-sh2218 and AAB12219), and culleded are anti-human Fas antibody CDR peptides (AAB12902-B12907).

CC AAA78202-A78206) and protein sequences (see AAB12908-B12910). Also included are anti-human Fas antibody CDR peptides (AAB12902-B12907).

CC Frimers specific for the anti-human Fas antibody, 1184t, heavy and kappa chains used in the invention are represented by sequences AAA78277-A78318 and AAA78335-CC A78335, while humanised anti-Fas Ig DNA sequences AAA782738-A78387. Primer sequences AAA78212 are specific for murine Ig DNA, and are used in the production of the agent of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

This antibody selectively binds to surface of haematopoeitic progenitor cells (HPC) and is transported into the cells by endocytosis. The invention provides conjugates of human Fanconi anaemia complementation group C (FAC) protein (see AAW68546) and anti-CD33 antibody (preferably a single chain antibody). A nucleic acid (see AAW33947) encoding the heavy chain can be ligated with vector pED6 and with FAC cDNA (see AAW33945) to provide a fusion protein. Alternatively, nucleic acids encoding the heavy and light chains (see AAW68549) of M195 are ligated into a bicistronic vector, antibody molecule is isolated from transfected cells, and chemically crosslinked to FAC protein (see AAW68546) to form a conjugate. The conjugate or fusion protein, or a nucleic acid encoding it, can be used to deliver FAC to an HPC, specifically to inhibit apoptosis, particularly in patients exposed to high doses of chemotherapy for treatment of non-wyeloid cancers, also to treat Fanconi anaemia (by complementation of the genetic defect).

Treatment of HPC is done in vitro, ex vivo (e.g. for recombinant production of conjugate in cell cultures) or in vivo. Treatment with FAC may eliminate the need for extensive bone marrow transplants to restore

The present invention describes a method of producing humanised coding a humanised involving expressing in a cell a nucleic acid encoding a humanised version of an immunoglobulin. This is obtained by comparing a donor and human immunoglobulin and producing a combined antibody which contains part of each. These are useful in the treatment of graft-versus-inset disease, transplant rejection, autoimmune diseases such as diabetes, rheumatoid arthritis, myasthenia gravis, multiple sclerosis and systemic lupus erythematosus, herpes infections, CWV virus infections and myeloid
                                                                                                                                                                                                                                                            Humanised immunoglobulin; mouse; human; antibody; heavy chain; diabetes; light chain; graft versus host disease; transplant; autoimmune disease; multiple sclerosis; rheumatoid arthritis; systemic lupus erythematosus; myasthenia gravis; herpes infection; myeloid leukaemia; CMV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Producing humanized immunoglobulin, involves producing a cell containin
DNA segments encoding humanized heavy and light chain variable regions,
and expressing the DNA segments in the cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  leukaemia. The present sequence is an antibody used to demonstrate method of the invention
                                                                                                                                                                                                                           Murine M195 antibody heavy chain SEQ ID NO: 69.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes a method of designing a humanised immunoglobulin (1g) chain. The method comprises substituting human framework amino acids of the acceptor Ig with a corresponding amino acid from the donor Ig at a position in the Igs, where the amino acid is immediately adjacent to one of the CDR's or the amino acid is predicted to have a side chain atom whose Van der Waals surface is 3 angstroms from the CDR's in threedimensional Ig model and is capable of interacting with the antigen or

cc with the CDR's of the humanised Ig that when the chain is a heavy chain, cc substituted amino acid(s) is capable of interacting with CDR's 2 or 3.

Also described are: an Ig comprising two light/heavy chains; a DNA sequence which upon expression encodes a humanised Ig chain; a composition comprising a DNA sequence coding for a composition comprising a DNA sequence coding for a composition comprising a pure humanised immunoglobulin cc capable of inhibiting pinding of human interleukin-2 (IL-2) to a human IL creceptor; treating to the patient a therapeutic dose of an Ig; and a composition comprising a pure humanised Ig reactive with the p75 chain of the human IL-2 receptor. The method is used for designing a humanised immunoglobulin chain, useful for treating T-cell mediated disorders in a human patient. The invented method produces an Ig chain that is easily can deconomically produced. This is the amino acid sequence of mouse M195 antibody heavy chain variable region. Residues in the human antibody to create framework can be replaced with residues from the mouse antibody to create
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ä

                                                                                                                     forms a hCH-binding antibody fragment (FhCG). For the production of Abs the variable region was fused to a constant region of human origin. The product can be used to prevent pregnancy or for combatting choritocarcinomas or other hCG-producing tumours. They also have diagnostic applications as immune reagents for in vivo diagnosis, eg for localisation of tumours and for in vitro diagnosis for detection of hCG in body fluids.     mucosal antigens, esp. against S
                                                                                                                                                                                                        The present sequence is the Guy's 13 anti-Streptococcus mutans antibody, gamma chain. The immunoglobulin (Ig) of the invention comprises a protection protein (PP), pref. a portion of the rabbit poly-Ig receptor, in association with an Ig derived light or heavy chain, having at least portion of an antigen (Ag) binding domain, specifically the Guy's 13 kappa or gamma chain. The Ig can be used to prevent dental caries by hinding S. mutans serotypes c, e and f, while the Pp protects the Ig in harsh mucosal, e.g. gastrointestinal, environments, therefore enhancing its effectiveness in passively immunising animals against mucosal pathogens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 MGWSWIFLFLLSGTAGVHSEVQLQQSGPELVKPGASVKISCKASGYTFTDYNIHWVKQSH 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ઠ
                                                                                                                                                                                                                                               Chimeric human Ab expression vectors are constructed by inserting the Ab heavy and light chain variable region-encoding cDNA isolated from hybridomas producing a mouse or rat monoclonal Ab reacting with the ganglioside GM2 respectively into an expression vector for use in animal cells which contains the human Ab heavy and light chain constant region-canding cDNA. The expression vectors are introduced into animal cells and the transformant thus obtained is cultured for the produ. of a chimeric human Ab reacting with the ganglioside GM2. In contrast to mouse monoclonal Abs, the chimeric human Abs will not cause anti-mouse Ig Ab prodn. in the patient's body but show a prolonged blood half-life, with a reduced frequency of adverse effects, so that it can be expected to be requerior to mouse monoclonal Abs in the efficacy in the treatment of human cancer, for instance. Mouse anti-GM2 monoclonal Ab KM-796 and KM-750 and rat KM-603 heavy and light chain sequences are given in AAQ45426-30. CDR regions for use in chimeric Abs are indicated in the Features

The chimeric human antibodies are useful in the treatment of cancer, especially that which is of neural ectodermal origin. In contrast to prior art constructs based on mouse monoclonal antibodies, the chimeric human antibodies do not cause anti-mouse immunoglobulin production. The chimeric human antibodies have a prolonged half-life and a reduced frequency of adverse effects when compared to mouse monoclonal antibodies. (Updated on 27-AUG-2003 to correct OS field.)

```
This amino acid sequence was isolated from mouse hybridoma cell line KM-796, and encodes for the anti-GM2 heavy chain. Chimeric human antibodies of the invention are useful in the treatment of cancer, especially that which is of neural ectodermal origin. In contrast to prior art constructs based on mouse monoclonal antibodies, the chimeric human antibodies do antibodies anti-mouse immunoglobulin production. The chimeric human antibodies antibodies have a prolonged half-life and a reduced frequency of adverse effects when compared to mouse monoclonal antibodies

```
antibody or its antigen binding portion, and a targetting agent where the antibody specifically binds to an antigen in a protein that binds to averantibody specifically binds to an antigen in a protein that binds to averantically binds to a cell surface protein that activates the phosphatidylinositol 3 (PISK) signalling pathway. The bifunctional molecules are useful for gene therapy, for promoting Adenoviral (Ad) vector-mediated gene delivery to cells lacking av integrins, for enhancing Ad binding and internalisation, and in gene perint trargetting of viral and bacterrial vectors to cells that express targeted receptors. Diseases that can be targetted include cancers, vascular disorders, diabetic retinopathies, restenosis, ophthalmic disorders, hyperproliferative disorders, and hormonal disorders. The present sequence is human penton base monoclonal antibody, DAV-1 heavy chain fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    61 GKSLEWIGYIYPYKGCTGYNQKFKSKATLTTDSSSNTAYMELRSLTSDASAVYYCARG-- 118

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1;
                                                                                                                                                                                                                                                                                                                                        The present invention relates to a bifunctional molecule comprising an antibody or its antigen-binding portion, and a targeting agent. The antibody specifically binds to an antigen in a protein that binds to alpha integrin, and the targeting agent specifically binds to a cell surface protein that activates the phosphatidylinositol-3-OH kinase (PI3K) signalling pathway. The bifunctional molecules are useful for targeted gene therapy using targeting delivery vectors, such as adenoviral gene delivery particles. The bifunctional molecules are useful for treating viral infections, rheumatoid arthritis, cancers, for treating viral infections, rheumatoid arthritis, cancers, cardiovascular disorders, diabetic retinopathies, restenosis, ophthalmic disorders, hyperproliferative disorders, and hormonal disorders. The present sequence represents a portion of the mouse DN-1 heavy chain that is used for a fusion protein bifunctional antibody

The present invention relates to a bifunctional molecule comprising an antibody or its antigen-binding portion, and a targetting agent where the antibody specifically binds to an antigen in a protein that binds to a vinceprin, and the targetting agent specifically binds to a cell surface protein that activates the phospharidylinositol 3 (PIXK) signalling pathway. The bifunctional molecules are useful for gene therapy, for promoting Ademoviral (Ad) vector-mediated gene delivery to cells lacking a vintegrins, for enhancing Ad binding and internalisation, and in gene delivery of by fibreless adenovirus particles. The bifunctional molecules cargetted receptors. Diseases that can be targetted include cancers, vascular disorders, diabetic retinopathies, restenosis, ophthalmic disorders, hyperproliferative disorders, and hormonal disorders. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           61 GKILEWIGYIYPYNGVSDYNQNFKSKATLIVDNSSNTAYMELRSLTSEDSAVYYCARWDF 120

The present invention relates to a bifunctional molecule comprising an antibody or its antigen-binding portion, and a targeting agent. The antibody or its antigen binds to an antigen in a protein that binds to an antigen in a protein that binds to surface protein that activates the phosphatidylinositol-3.0H kinase fursty signalling pathway. The bifunctional molecules are useful for targeted gene therapy using targeteing delivery vectors, such as adenoviral gene delivery particles. The bifunctional molecules are useful for treating viral infections, rheumatoid arthritis, cancers, cardiovascular disorders, diabetic retinopathies, restenosis, ophthalmic disorders, hyperproliferative disorders, and hormonal disorders. The present sequence represents mouse DAV-1 heavy chain, penton base 9 1 MGWSWIPLFLLSGTAGVHSEVQLQQSGPELVKPGASVKISCKASGYTFTDYNIHWVKQSH Gaps 7; 79.2%; Score 600.5; DB 5; Length 456; 82.0%; Pred. New modified adenovirus fiber protein comprising a fiber shaft and a modified knob, useful for treating cancer, vascular disorders, diabetic retinopathies, restenosis and vascular, ophthalmic, hyperproliferative c hormonal disorders.

Example 1; SEQ ID NO 28; 250pp; English.

The invention relates to a modified adenovirue fiber protein comprising a fiber shaft that contains a sufficient number of shaft repeats to permit trimerization in the absence of a fiber knob or in the absence of an extrinsic trimerization domain, and optionally a modified knob, where, if the knob is included, it is modified to remove or disable the conditions of the knob. The invention also relates to a condition domain of the knob. The invention also relates to a condition of the knob removes or disables a trimerization domain of the knob, and the modified fiber trimerizes a nucleic acid molecule comprising a sequence of nucleotides that encodes the modified adenovirus fiber protein, a cell comprising the adenovirus particle comprising the modified fiber, a composition formulated for administration to a subject, comprising the adenovirus particle, detargeting an adenoviral vector particle comprising of the particle to a native adenoviral particle, where the binding of the particle to a native containing the unmodified fiber, introducing the adenovirus particle into containing the unmodified fiber, introducing the adenovirus fiber protein is cented to the subject and administering the introducing the cells into a subject and administering the interest variation to the subject. The modified adenovirus fiber protein is composition for the subject. The modified adenovirus fiber protein is composition for the subject. The modified adenovirus fiber protein is useful for treating cancer, vascular disease, diabetic retinopathy, restenosis, ocular diseases, hyperproliferative disorders and hormonal disorders. This sequence represents a DAV-1 antibody heavy chain used in the scope of the invention.

The present invention relates to a bifunctional molecule comprising an antibody or its antigen-binding portion, and a targetting agent where the antibody specifically binds to an antigen in a protein that binds to aventice antibody specifically binds to an antigen in a protein that binds to a cell surface integrin, and the targetting agent specifically binds to a cell surface protein that activates the phosphatidylinositol 3 (PI3K) signalling promoting Adenoviral (Ad) vector-mediated gene delivery to cells lacking av integrins, for enhancing Ad binding and internalisation, and in gene calivery of by fibreless adenovirus particles. The bifunctional molecules permit targetting of viral and bacterial vectors to cells that express targetted receptors. Diseases that can be targetted include cancers, asscular disorders, diabetic retinopathies, restenois, ophthalmic disorders, hyperproliferative disorders, and hormonal disorders. The present sequence is human N-terminal DAV-1 heavy chain-mature epidermal growth factor (EGF) fusion protein which is used in the invention
                                                                                                                                                                                                                                                                                                                              Human; bifunctional molecule; monoclonal antibody; gene therapy; cancer; vascular disorder; disorder; cathopathy; restenosis; ophthalmic disorder; hyperproliferative disorder; hormonal disorder; DAV-1 heavy chain; cytostatic; vasotropic; ophthalmological; epidermal growth factor; EGF;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                    US-10-687-035-33
